Quality Measure Tip Sheet: Pain – Long Stay

Quality Measure Overview

Numerator:

• This measure captures the percentage of long-stay residents who self-report either:
  – Almost constant or frequent moderate to severe pain in the last five days or
  – Any very severe/horrible pain in the last five days

• Pain is to be listed on your quality measures based on the pain interview.

• If a resident cannot communicate (e.g., verbal, gesture, written), then staff observations for pain behavior will be used.

• Pain is defined as whatever the experiencing person says it is, existing whenever the experiencing person says it does.

Denominator: All long-stay residents with a selected target assessment, except those with exclusions

MDS Coding Requirements

In the Minimum Data Set (MDS):

• Code if the resident
  – received a scheduled pain medication regimen;
  – received PRN pain medications or was offered and declined;
  – received nonmedication intervention for pain;
  – indicated pain is present during pain interview.

Ask These Questions…

• Is the resident’s pain interview done at a time that is good for the resident?

• Is the pain interview completed with a staff member if the resident cannot communicate, and does that staff member understand he/she is not to input opinions?

• Is the resident interview individualized to obtain an accurate picture? For example, if the resident has discomfort following therapy, activities of daily living (ADLs) or procedures, medicate him/her before the activities and do not interview him/her immediately following the therapy.

• Is the resident reassured that pain medication will not be taken away if he/she states there is no current pain?

• Is the resident able to reference a visual pain scale such as the Wong-Baker face scale?

• Have there been changes in sleep cycles and has that need been addressed?

• Has acetaminophen at bedtime been care planned and tried for this resident?

• Has the resident shown a change in mood (e.g., sad, apathetic, anxious, increased behaviors)?

• Has there been a loss of involvement in routines?

• Is there an underlying condition that may need to be treated such as arthritis, cancer, fractures, osteoporosis, multiple sclerosis, dental caries and skin impairment?

• Is the resident’s pain medication individualized prior to treatment and/or procedures?

• Is medication scheduled on a routine basis for better management?

• Is as-needed medication used for breakthrough (short-acting) pain?

• Are therapy methods such as TENS, relaxation techniques, range of motion, ADL programs, warm/cool compresses, distraction exercises, massage and positioning devices involved in treating pain?

• Are consultations made to pain management clinics as needed?
